Wagner wallpaper steamer not working

Depending on the amount of water in the container, it can take up to 12 minutes for the system to generate steam. A full container generates steam for around 95 minutes. We recommend descaling our wallpaper steamers after every 6th use. How often you have to descale a device depends significantly on the water hardness. You can determine this using a water hardness test, which can be purchased in DIY stores or online. If the wallpaper steamer no longer boils the water or switches off after a short steam phase, descale the device. Limescale can settle on the heating element and insulate it. As a result, the heating element can no longer give off sufficient heat to the water. The temperature at the heating element continues to rise and the wallpaper steamer switches itself off for safety reasons. Use commercially available liquids or tablets to descale the system and pour 1.5 litres of water into a measuring cup. Add the required amount of descaler according to the manufacturer's instructions and mix the solution thoroughly. Pour the descaling solution into the device. Switch on the wallpaper steamer. Switch off the wallpaper steamer after about 10 minutes and unplug the device. Allow the descaling solution to soak for another 30 minutes. Then empty the wallpaper steamer completely. Then rinse the device thoroughly several times with fresh water to remove all residues of the descaling solution. No. The device is not designed for any other applications. If you use the product for other applications, the guarantee becomes null and void. In the case of multi-layered and painted wallpapers, incisions or perforations can ensure that the steam can penetrate through the layer. This makes the wallpaper peel off more easily. The water that is filled into the steamer is heated to boiling point and the steam that is released can scald the skin! Protect your skin from contacting the steamer plate and wear protective gloves. Top positive review All positive reviews Queen of Kings 5.0 out of 5 stars Science 101: confined steam makes water so get over it Whiners Reviewed in the United States on February 13, 2016 News Flash: For all the people leaving one and two star ratings for this wonderful machine, you are suffering from inexperience and you don't know diddly about wallpaper. Wallpaper hanging and removal is hard work and it's messy no matter the method of removal. It's the nature of the beast. This Wagner wallpaper steamer is the absolute best way to remove wall paper. Less messy than any spray on goop. Yes, some water does run down the wall because it's a STEAMER and steam confined in a closed paddle makes water. Science 101 folks. Throw down a towel and keep it moving. The secret is to start at a corner and keep the paddle moving, gently pulling on the corner of the wallpaper as you go. Beautiful and easy. And for you one star folks that claim this machine ruined your walls, another news flash: You ruined your walls by leaving the steam paddle in one place for too long. Read the directions next time. And on a final note, the small amount of water that does run down the wallpaper actually helps with the removal. This is an excellent device if you use it correctly. 5 Stars. Wife has talked me into an impromptu spot of decorating. Bloody wallpaper stripper has packed up...at the right fill level and gets to boiling point but then cuts out before any steam gets anywhere near the wall. Plug hot - changed fuse which made no difference which I kind of knew would be the case...any ideas before I bin it? Cheers Posted 4 years ago maybe just let the wife deal with the stripping, you can peel off the soggy bits after. Posted 4 years ago There cheap enough not to worry about it, though I would expect it the heater element is at fault...the plugs always heat up IME. Posted 4 years ago plug getting hot suggests its drawing too much current. Should be quite a simple device inside, maybe a bad connection to the element or limescale build up causing a problem somewhere. Posted 4 years ago Advertisements Forgor the wallpaper stripper and either peel off the outer paper and soak the backing paper with hot soapy water then scrape off. Or score the outer paper and spray with a diluted solution of a product called zinsser dif (wear a mask) you will save yourself hours! Posted 4 years ago You need to shove more \$5 bills in her g string to get a response. Posted 4 years ago lion - did option 1. Seems a shame to buy a new one if it's a cheap simple fix though. Posted 4 years ago Limescale on the element. I made a ghetto hay steamer for the wife using wallpaper stripper and it stopped working, looked inside and the element was covered, kept cutting out before steam emerged. Bottle of cheap vinegar in, boil and away to go. Posted 4 years ago There's not much to them, it's just a big kettle! There'll be a thermal cut-off in case it runs dry - so a build-up of limescale on the heating elements could cause this to trip. So try cleaning as suggested above. Posted 4 years ago Word of advice. I didnt have access to a wallpaper stripper so i did the soak the paper in water trick but i didnt realise how shonky the wiring was in the light switch. Water managed to get in to the socket and ended up electrifying the entire now wet wall which i only realised when i touched it with the scraper. I thought the little tingle/shock in my hand was just cramp or a nerve so i tried again...yep got shocked again. Turned the lecy off as i wasnt really enjoying the experience! Posted 4 years ago PROBLEM A. Unit fails to heat up. Red Power light DOES NOT illuminate when ON/OFF switch is set to ON. B. Unit fails to heat up. Red Power light DOES illuminate when ON/ OFF switch is on. C. Steam output is weak or intermittent D. Excessive amounts of water in steam NOTE: The Power Steamer produces a great deal of steam. The steam may condense as water or water droplets in the steam hose and tools and nozzle, which are then expelled when used after a period of cooling. This is normal and not a cause for concern. E. Accessories do not stay firmly connected to main nozzle F. Floor surfaces appear to have streaks after cleaning 12 CAUSE 1. Unit is not plugged in. 2. Loose electrical connection. 3. Unit is damaged or in need of repair. 1. Water tank is empty. 2. Mineral build-up in unit. 3. Unit is damaged or in need of repair. 1. Water level in tank is running low. 2. Steam hose may be kinked internally. 3. Mineral build-up in unit. 1. Water condensation in steam hose. 2. Water tank has been over filled. 3. Unit has not heated to full operating temperature. 1. Accessories are not properly installed. 1. Cleaning pad is dirty. 2. Hard water residue on the floor. EN REMEDY 1. Check wall outlet. 2. Discontinue use and call Customer Service. 3. Discontinue use and call Customer Service. 1. Refer to Filling Water Tank procedure on Page 5. 2. Refer to Mineral Build-up section on page 11 for cleaning procedure. 1. Point nozzle towards sink, and shake while pressing steam trigger. 2. Filling the water tank with more than 40 oz / 1200 ml of water interferes with steam production resulting in water condensation. Turn unit off, let it cool and drain some water out of tank. 3. Wait until Orange steam pressure indication light has turned off. 1. Refer to accessory installation on pages 7-9. 1. Replace the cleaning pad with a clean one. 2. Switch to distilled or de-mineralized water. Wallpaper is a lovely way to decorate your home and to give a very unique look to any space. It is also a bear to remove. You can buy wallpaper steamers that help to soften and loosen the glue to make the wallpaper easier to remove, these too get dirty however. Learning how to descale and clean your wallpaper steamer can help prolong its life and get you even more bang for your buck. How Does a Wallpaper Steamer Work? A wallpaper steamer is made a great deal like a clothes or fabric steamer. It has a reservoir or tank, a heater, a hose and the tool on the end that works to remove the wallpaper. The steamer heats water that has been added to the tank up until it turns into steam then forces it up the hose and out of the tool or end that is being used. The steam helps to heat up and break down the wallpaper glue through the paper. Wallpaper glue is water soluble so the steam helps to break the bonds of the glue through hydrolysis. When the glue is broken down, the wallpaper can be scraped off of the wall and removed so that it can be painted or so that new paper can be applied. This process helps to make removal of wallpaper faster, cleaner and helps to remove the paper nearly completely so that you can get to work on putting up new wall coverings or putting up new wallpaper. Steamers are a great way to cut down the time that it takes to remove wallpaper so that you can get it off the wall without the chemical strippers, without the heavy duty scraping tools and without much of the work you would deal with otherwise. Why Might Your Wallpaper Steamer Get Clogged? Just like a normal steamer, wallpaper steamers can get clogged and can cause problems with the overall ease of use. If your wallpaper steamer is dirty, if the water you are using is hard water, or if there is any sort of build up in the steamer it can cause problems. If you live where hard water is common or where the water that you are using might be harder than normal, build up and mineral deposits can form in your steamer and can cause a real problem with your steamer and how it works. Wallpaper steamers can get clogged in the hose, in the steamer head and even in the tank. It can be so hard to keep your wallpaper steamer clean and descaled, but descaling can help it last longer and work better each time you get it out to use it. How to Descalate your Wallpaper Steamer? There are a few different ways that you can descalate your wallpaper steamer and can help to get it clean and ready to use each time. Remove old water Add clean, distilled water and descaler solution Run the stripper until the reservoir is half empty Check effectiveness Dump out remaining water and clean the stripper head The first step is going to be to remove the water that might still be in your wallpaper steamer. If the water is still very hot or if you have just used the steamer, you want to give it plenty of time to cool off so that you can avoid burns and you can avoid getting hurt when trying to remove the water. After removing the water from the reservoir, you then want to put distilled water into the tank along with the descaling product of your choice. There are a few different products that you can choose from, make sure you choose a descaler that is compatible with your steamer and that is not going to cause any damage within it. You can then follow the instructions that are included with the product to make sure you add the right amount. After you have added the descaling solution, you need to turn the steamer on and allow it to run until the tank is about half the way empty. This does a few things, for starters it helps to make sure that the solution is making it all the way through the machine and that it has the chance to remove build up from the entire machine. This also allows you the chance to check and see how the machine is working. If it seems to be working well and with no issues, you can turn it off and allow the water to cool before disposal. If the steamer is still clogged or does not seem to be working well, you can run the remainder of the tank through the steamer. After you have used the descaling solution in the machine, you can dispose of the water and allow the steamer to cool and dry before putting it away. You do want to make sure that you are cleaning the steamer head fully when you do put it away so that the glue does not dry and harden on the steamer head. How to Make Your Wallpaper Steamer Last Longer The first thing that you should keep in mind with a wallpaper steamer is that it is a tool that you are not likely to use super often. Unless you are working in an industry where you are stripping wallpaper every day, you are not likely to be using your steamer more than once a year. This means that when the steamer is put away, it needs to be clean and it needs to be as dry as possible. Your first step is going to be to clean out your tank as soon as you are done using it. Dump out all the old water, do a wipe down if necessary, and even rinse out the tank to make sure that there is no residue or build up in the tank. You also want to make sure you run some sort of cleaner through your steamer when you are done to help remove build up from the inside out. You also want to make sure that the head of your steamer is clean and that there is no glue or residue on the head before you put it away. With any sort of steamer, it is always best to make sure that you remove as much water as possible before you put it away to prevent the growth of mold and mildew. With a tool like a wallpaper steamer that you are not using all that often, it is not a terrible idea to descale it after each use. A wallpaper steamer is a great thing. It helps to make the process of removing wallpaper faster, cleaner and simpler and is a super helpful tool. If you are using a wallpaper steamer, you want to keep it clean and to make sure that it is not being put away with water still in it. Keeping your steamer clean and descaled is going to help you keep it working longer so that you can get as much use from it as possible. Wallpaper steamers are not inexpensive, making the most of it is a must. Meta Description: Is your wallpaper steamer looking a bit dirty? Here are five steps to descale it to get the most out of this machine. Home » How-To's / Guides » How to Clean & Descalate A Wallpaper Steamer In 5 Easy Steps
